	EXAMINATION QUESTIONS/SOLUTIONS 2012-2013	Course Comp245
Question 3.		Marks & seen/unseen
Parts	<p>(i)</p> $\sum_{x=0}^{\infty} p_X(x) = e^{-\lambda} \sum_{x=0}^{\infty} \frac{\lambda^x}{x!} = e^{-\lambda} e^{\lambda} = 1.$ <p>(ii)</p> $\frac{p_X(x)}{p_X(x-1)} = \frac{\lambda}{x}.$ <p>Hence $p_X(x)$ will be greater than or equal to $p_X(x-1)$ whilst $x \leq \lambda$. Formally, for $x \in \{1, 2, \dots, \lfloor \lambda \rfloor\}$.</p> <p>(iii) Since $p_X(x)$ is non-decreasing in x until $x = \lfloor \lambda \rfloor$, and is decreasing thereafter, $\lfloor \lambda \rfloor$ will always provide a maximum of p_X.</p> <p>(iv) The mode is unique when λ is not an integer.</p> <p>When λ is an integer, then both λ and $(\lambda - 1)$ are maxima of p_X, since the ratio of their probability mass function values will be 1.</p> <p>(v) For $z = 0, 1, 2, \dots$,</p> $\begin{aligned} P(Z = z) &= \sum_{x=0}^z p_X(x) p_Y(z-x) = \sum_{x=0}^z \frac{\lambda^x e^{-\lambda}}{x!} \frac{\mu^{z-x} e^{-\mu}}{(z-x)!} = e^{-(\lambda+\mu)} \sum_{x=0}^z \frac{\lambda^x \mu^{z-x}}{x!(z-x)!} \\ &= \frac{e^{-(\lambda+\mu)}}{z!} \sum_{x=0}^z \binom{z}{x} \lambda^x \mu^{z-x} \\ &= \frac{e^{-(\lambda+\mu)} (\lambda + \mu)^z}{z!} \end{aligned}$ <p>by the binomial theorem. This is the probability mass function of a Poisson($\lambda + \mu$) random variable.</p>	<div>seen ↓</div> <div>3 marks</div> <div>unseen ↓</div> <div>4 marks</div> <div>3 marks</div> <div>2 marks</div> <div>2 marks</div> <div>6 marks</div>

	EXAMINATION QUESTIONS/SOLUTIONS 2012-2013	Course Comp245
Question 4.		Marks & seen/unseen
Parts	<p>(i) For f to be a density function,</p> <p>I. $f(x) \geq 0, \forall x \in \mathbb{R};$</p> <p>II. $\int_{x=-\infty}^{\infty} f(x)dx = 1.$</p> <p>(ii)</p>  <p>(iii) From the second point, we have</p> $1 = \int_{x=-\infty}^{\infty} f(x)dx = c_{\tau} \left\{ \int_{x=0}^{\tau} xdx + \tau \int_{x=\tau}^1 dx \right\} = c_{\tau} \left\{ \frac{\tau^2}{2} + \tau(1 - \tau) \right\}$ $\Rightarrow c_{\tau} = \frac{2}{2\tau - \tau^2}.$ <p>(iv) Let $g(\tau) = 2\tau - \tau^2$ be the denominator of c_{τ}. Then the derivative $g'(\tau) = 2(1 - \tau)$ is positive for $\tau \in (0, 1)$, implying that g is increasing and hence c_{τ} is decreasing in τ. However,</p> $c_{\tau}\tau = \frac{2\tau}{2\tau - \tau^2} = \frac{2}{2 - \tau}$ <p>is clearly increasing in τ.</p> <p>(v) For $\tau \geq x$, we have seen that c_{τ} is decreasing in τ, so for τ within $(x, 1)$, $f(x)$ is maximised by $\tau = x$. For $\tau \leq x$, we have seen $c_{\tau}\tau$ is increasing in τ and so is again maximised by $\tau = x$. Hence $\hat{\tau} = x$ is a global maximum and hence the MLE for τ.</p>	<div>seen ↓</div> <div>3 marks</div> <div>seen sim. ↓</div> <div>3 marks</div> <div>5 marks</div> <div>3 marks</div> <div>3 marks</div> <div>unseen ↓</div> <div>3 marks</div>
